                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TYPOSINE Phosphate.

1. SUBCELLULAR LOCATION: Type I membrane protein.

2. DEVELOPMENTAL STAGE: EXPRESSED AT HIGH LEVELS DURING EARLY EMBRYONIC DEVELOPMENT. THE EXPRESSION LEVELS DROP STRONGLY AROUND DAY 16 AND THERE ARE ONLY VERY LOW LEVELS IN ADULT TISSUES.

2. IDISEASE: DEFECTS IN ROR2 ARE A CAUSE OF BRACHYDACTYLY TYPE B REPAIR OF THE AN AUTOSOMAL DOMINANT SKELEFAL DISORDER OF BRACHYDACTER AND NAILS. IN BDB IS AN AUTOSOMAL DOMINANT SKELEFAL DISORDER AND NAILS. IN BDB THE MIDDLE PHALANGES ARE SHORT BUT IN ADDITION THE TERMINAL PHALANGES ARE RUDIMENTARY OR ABSENT. BOTH FINGERS AND TOES ARE PHALANGES ARE RUDIMENTARY OR ABSENT. BOTH FINGERS AND TOES ARE AFFECTED. THE THUMBS AND BIG TOES ARE USUALLY DEFORMED.

2. DISEASE: DEFECTS IN ROR2 ARE A CAUSE OF RECESSIVE ROBINOW SYNDROME AFFECTED BY SKELETAL DYSPLASIA WITH GENERALIZED LIMB BONE SHORTENING, SEGMENTAL DEFECTS OF THE SPINE, BRACHYDACTYLY AND A DYSMORPHIC FACIAL APPEARANCE.

2. SIMILARITY: CONTAINS 1 FRIZILED (FZ) DOMAIN.

3. SIMILARITY: CONTAINS 1 KRINGLE DOMAIN.

3. SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN.

4. BEYONGS TO THE ROPE SIRPANHIVE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               van Bokhoven H., Celli J., Kayserili H., van Beusekom E., Balci S., Brussel W., Skovby F., Kerr B., Percin E.F., Akarsu N., Brunner H.G.; Nat. Genet. 26:383-383(2000).

1- FUNCTION: TYROSINE-PROTEIN KINASE RECEPTOR WHICH MAY BE INVOLVED IN THE EARLY FORMATION OF THE CHONDROCYTES. IT SEEMS TO BE
                                                                                                                                                                                                                                                                                                   EMBL;

SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY: CONTAINS 1 FRIZZLED (FZ) DOMAIN.
SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.
SIMILARITY: CONTAINS 1 KRINGLE DOMAIN.
SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE ROR SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: TYROSINE-PROTEIN KINASE RECEPTOR WHICH MAIN THE EARLY FORMATION OF THE CHONDROCYTES. FUNCTION: CONVERTS THE ABUNDANT, BUT INACTIVE, ZYMOGEN PLASMINOGEN.
TO PLASMIN BY HYDROLYZING A SINGLE ARG-VAL BOND IN PLASMINOGEN. BY
CONTROLLING PLASMIN-MEDIATED PROTEOLYSIS, IT PLAYS AN IMPORTANT
ROLE IN TISSUE REMODELING AND DEGRADATION, IN CELL MIGRATION AND
MANY OTHER PHYSIOPATHOLOGICAL EVENTS.
CATALYTIC ACTIVITY: Specific cleavage of Arg-I-Val bond in

BOND.

SUBCELLULAR LOCATION: SECRETED; EXTRACELLULAR.

PTM. THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHE PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG-308 CATALYZED BY PLASMIN, TISSUE KALLIKREIN OR FACTOR XA.

MISCELLANEOUS: BINDS TO THE KRINGLE STRUCTURE OF THE FIBRIN A CHAIN, BINDING TO FIBRIN ENHANCES ITS CATALYTIC ACTIVITY.

SIMILARITY: CONTAINS 1 EGF-LIKE DOMAIN.

SIMILARITY: CONTAINS 2 KRINGLE DOMAIN.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE TRYPSIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           "The structure of the TATA-less rat tissue-type plasminogen activator gene. Species-specific sequence divergences in the promoter predict differences in regulation of gene expression.";

J. Biol. Chem. 265:2022-2027(1990).

-I- FUNCTION: CONVERTS THE ABUNDANT, BUT INACTIVE, ZYMOGEN PLASMINOGEN. TO PLASMIN BY HYDROLYZING A SINGLE ARG-VAL BOND IN PLASMINOGEN. BY CONTROLLING PLASMIN-MEDIATED PROTEOLYSIS, IT PLAYS AN IMPORTANT ROLE IN TISSUE REMODELING AND DEGRADATION, IN CELL MIGRATION AND MANY OTHER PHYSIOPATHOLOGICAL EVENTS.

-I- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.

-I- SUBBUNIT: HETERODIMER OF CHAIN A AND CHAIN B HELD BY A DISULFIDE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-FEB-1991 (Rel. 17, Created)

RL J. BIOL. Chem. 267:5102-5107(1992).

CC -!- FUNCTION: FACTOR XII IS A SERUM GLYCOPROTEIN THAT PARTICIPATES IN THE INITIATION OF BLOOD COAGULATION, FIBRINOLYSIS, AND THE CC GENERATION OF BRADYKININ AND ANGIOTENSIN.

CC -!- CATALYTIC ACTIVITY: Cleaves selectively Arg-|-1le bonds in factor CI to form factor VII a and factor XI to form factor XIA.

CC -!- CATALYTIC ACTIVITY: Cleaves selectively Arg-|-1le bonds in factor CI to form factor XIA.

CC -!- PMM: O- AND N-GLYCOSYLATED.

CC -!- PMM: O- AND N-GLYCOSYLATED.

CC -!- PMM: O- AND N-GLYCOSYLATED.

CC -!- PMM: O- AND M-GLYCOSYLATED.

CC -!- PMM: O- AND M-GLYCOSYLATED.

CC -!- MISCELLANEOUS: FACTOR XII, PERCALLIKREIN, AND HMW KININGEN FORM A COMPLEX BOUND TO AN ANIONIC SURFACE, PREKALLIKREIN IS CLEAVED BY FACTOR XII AND THEN TO BETA-FACTOR XII FIRST COMPLEX BOUND TO AN ANIONIC SURFACE, PREKALLIKREIN IS CLEAVED BY FACTOR XII AND THEN TO BETA-FACTOR XII FIRST CONTAINS 2 EGF-LIKE DOMAIN.

CC -!- SIMILARITY: CONTAINS 2 EGF-LIKE DOMAIN.

CC -!- SIMILARITY: CONTAINS 1 FIBRONECTIN TYPE I DOMAIN.

CC -!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE TRYPETN FAMILY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CATALYTIC ACTIVITY: Cleaves selectively Arg-[-Ile bonds in factor VII to form factor VIIa and factor XI to form factor XIa.

VII to form factor VIIa and factor XI to form factor XIa.

MISCELLANEOUS: FACTOR XII, PREKALLIKERIN, AND HMW KININOGEN FORM A COMPDEX BOUND TO AN ANIONIC SURFACE. PREKALLIKREIN IS CLEAVED BY FACTOR XII TO FORM KALLIKREIN, WHICH THEN CLEAVES FACTOR XII FIRST TO ALPHA-FACTOR XIIA AND THEN TO BETA-FACTOR XIIA. ALPHA-FACTOR XIA ACTIVATES FACTOR XI TO FACTOR XIA.

SIMILARITY: CONTAINS 1 FIBRONECTIN TYPE I DOMAIN.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE TREVESTIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TRYPSIN FAMILY.

STRANDED RNA AND DNA.

STRANDED RNA AND DNA AND PRESENCE OF THYROID HORMONE FOR ITS INTERRACTION.

ALTERNATIVE PRODUCTS: 2 ISOPORMS; P56 (SHOWN HERE) AND P30; MAY BE PRODUCED BY ALTERNATIVE SPLICING.

TISSUES SPECIFICITY: EXPRESSED IN MOST TISSUES, WITH THE HIGHEST LEVELS IN PRIMARY BLOOD LEUKOCYTES AND OTHER HEMATOPOIETIC SYSTEM TISSUES, COLON, STOMACH AND TO SOME EXTENT IN TESTIS.

INDUCTION: BY INTERFERONS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SIMILARITY: BELONGS TO THE 2-5A SYNTHETASE FAMILY. "Polyglutamylation of folate coenzymes is necessary for methionine biosynthesis and maintenance of intact mitochondrial genome in Saccharomyces cerevisiae.";

J. Biol. Chem. 275:14056-14063(2000).

I. FUNCTION: CONVERSION OF FOLATES TO POLYGLUTAMATE DERIVATIVES.

I. CATALYTIC ACTIVITY: ATP + {tetrahydrofolyl-[Glu]}(N) + L-glutamate = ADP + phosphate + {tetrahydrofolyl-[Glu]}(N+1).

I. SIMILARITY: BELONGS TO THE FOLYLPOLYGLUTAMATE SYNTHASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ACT_SITE
